Binary collision-induced dissociation was applied to the target ion 1-methyne-2,3-dimethylcyclopropane (1) to study the mechanism of formation of the strong donor-acceptor complex benzyne (HCC)2. Three product ions were observed: the HC- ion, which is produced by the loss of a methyl group, and the two C2H4- ions, which are formed by loss of CH2 groups from the ring. In addition, the HDCC- ion, which is formed by transfer of a deuterium atom from deuterium atoms in the gas phase to the
